

## 3.12 Assignment: Iteration Plan for Sprint 1

### Written By Fahim Arsad Nafis

- **The self-assigned tasks** can create a problem. Expertise level is not the same for all the developers. The scrum master should play a vital role here.
- **Designing a wireframe** is undoubtedly a very good idea. It will provide a better assumption to both developers and the stakeholders about what is going to be developed.
- **Pair Programming** during writing the source code may slow down the pace of the team. On the other hand, it is a perfect approach to generate quality code.
- Having **unit tests and acceptance tests** will help to verify and validate the user requirement. A good amount of unit test and acceptance test must be conducted.
- Documentation plays a great role during and post-development stage. The code is written once but is read by multiple people at multiple times. Documentation must be done properly during the development phase.
